Application

Test to measure verbal and temporal planning ability in healthy individuals and in psychiatric and neurological patients. The test measures the respondent's ability to select information, to structure it to create an action plan, to mentally check the plan and then to implement it in a controlled manner. PAD is based on a day-planning paradigm. Tasks of this type require respondents to devise a plan for carrying out a given list of errands (e.g. shopping, going to the doctor, meeting friends) in an efficient order, taking account of various constraints (e.g. time limits on when particular tasks can be carried out, distances between locations).

This test has been developed mainly for use in neuropsychological assessment. It is particularly appropriate for patients with neurological or psychiatric disorders in which the executive functions may be impaired, such as schizophrenia or depression. The test is used by experts who prepare neuropsychological reports and in determining ability prior to training or rehabilitation measures.

Task

The testee carries out plans for the day using a virtual map. He/She must devise an appropriate strategy and decide in which order to carry out the tasks and visit the different buildings.

Test forms

One test form.

Analysis

The following main variable is scored:
 Planning ability: Mean working time – Measure of the ability to select information and structure it to create an action plan.

Duration

approx. 20 minutes

Valid age

Norms for ages 17+.

Report elements

<input checked="" type="checkbox"/>	Table	<input type="checkbox"/>	Test protocol
<input type="checkbox"/>	Profile	<input checked="" type="checkbox"/>	Item analysis protocol
<input checked="" type="checkbox"/>	Working time	<input type="checkbox"/>	Progress chart
<input checked="" type="checkbox"/>	Confidence interval	<input type="checkbox"/>	Special diagrammatic representation of results
<input type="checkbox"/>	Profile analysis	<input type="checkbox"/>	Personalized Word report
